

SPINOSAURUS

SPECIES NUMBER: SN-62279

FAMILY: SPINOSAURIDAE

DIET: CARNIVORE

HEIGHT: 1 FT

WEIGHT: 15 LBS

LENGTH: 45 FT

ANIMAL DESCRIPTION: Originally believed to be a Metriacanthosaurus, Spinosaurus is the largest predator on Isla Sorna. It was believed that his crocodile like snout was specialized on a piscivore diet, but it has proved to be an apex predator who, once has tagged one prey, will not stop until it kills it. This dinosaur is robust, tough and very hard to kill. Its hunting technique consists on twisting its prey's neck or limbs rather than biting and shaking like the T.rex.

ANIMAL LOCATION: Unlike Tyrannosaurus, Spinosaurus is not territorial and has a rogue behavior. It makes a circuit around all Isla Sorna looking for its prey and can be encountered anywhere where there are big animals if it is around and not in other phase of its circuit cycle. Tagging and Tracking is extremely hazardous. If done, it must be done with camouflage.
